Homework 7

Michael Brodskiy

Professor: I. Salama

March 16, 2025

1. (a) Using our formulas to obtain the marginal PDFs, we write:

$$f_X(x) = \int_0^\infty f_{XY}(x, y) \, dy$$

$$f_Y(y) = \int_0^\infty f_{XY}(x, y) \, dx$$

This gives us:

$$f_X(x) = 8e^{-4x} \int_0^\infty e^{-2y} dy$$

$$f_Y(y) = 8e^{-2y} \int_0^\infty e^{-4x} dx$$

We continue to solve to get:

$$f_X(x) = 8e^{-4x} \int_0^\infty e^{-2y} dy$$

$$f_X(x) = -4e^{-4x} \left[e^{-2y} \right] \Big|_0^{\infty}$$

$$f_X(x) = 4e^{-4x}, \quad x \ge 0$$

$$f_Y(y) = 8e^{-2y} \int_0^\infty e^{-4x} dx$$

$$f_Y(y) = -2e^{-2y} \left[e^{-4x} \right] \Big|_0^{\infty}$$

$$f_Y(y) = 2e^{-2y}, \quad y \ge 0$$

We may observe that the two are independent random variables, since:

$$f_{XY}(x,y) = f_X(x)f_Y(y)$$

$$f_{XY}(x,y) = (4e^{-4x})(2e^{-2y})$$

$$f_{XY}(x,y) = 8e^{-(4x+2y)} \checkmark$$

Furthermore, we may see that the individual PDFs follow an exponential form, with $[\lambda_x = 4]$ and $[\lambda_y = 2]$

(b) We may express this probability using the bounds defined by $y \ge 0$ and $x \ge y$, which gives us:

$$P[X > Y] = \int_0^\infty \int_y^\infty 8e^{-4x}e^{-2y} \, dx \, dy$$

We solve this to get:

$$P[X > Y] = \int_0^\infty -2e^{-2y} \left[e^{-4x} \right] \Big|_y^\infty dy$$

$$P[X > Y] = \int_0^\infty 2e^{-6y} dy$$

$$P[X > Y] = -\frac{1}{3} \left[e^{-6y} \right] \Big|_0^\infty$$

$$P[X > Y] = \frac{1}{3}$$

Similarly, we pay express $P[X+Y\leq 1]$ with bounds of $0\leq x\leq 1$ and $0\leq y\leq 1-x$, which gives us:

$$P[X+Y \le 1] = \int_0^1 \int_0^{1-x} 8e^{-4x}e^{-2y} \, dy \, dx$$

We solve this to get:

$$P[X+Y \le 1] = \int_0^1 -4e^{-4x} \left[e^{-2y} \right] \Big|_0^{1-x} dx$$

$$P[X+Y \le 1] = \int_0^1 -4e^{-4x} \left[e^{-2+2x} - 1 \right] dx$$

$$P[X+Y \le 1] = -4e^{-2} \int_0^1 e^{-2x} dx + 4 \int_0^1 e^{-4x} dx$$

$$P[X+Y \le 1] = 2e^{-2} \left[e^{-2x} \right] \Big|_0^1 - \left[e^{-4x} \right] \Big|_0^1$$

$$P[X+Y \le 1] = 2e^{-4} - 2e^{-2} - e^{-4} + 1$$

$$\boxed{P[X+Y \le 1] = .7476}$$

(c) Since X and Y are independent, we can expand this statement to write:

$$P[\min(X,Y) \ge .5] = P[X \ge .5, Y \ge .5] \to P[X \ge .5] P[Y \ge .5]$$

As such, we find each component as:

$$P[X \ge .5] = \int_{.5}^{\infty} 4e^{-4x} dx$$
$$P[Y \ge .5] = \int_{.5}^{\infty} 2e^{-2y} dy$$

We solve to find:

$$P[X \ge .5] = -\left[e^{-4x}\right]\Big|_{.5}^{\infty}$$

 $P[X \ge .5] = -\left[0 - e^{-2}\right]$
 $P[X \ge .5] = .1353$

$$P[Y \ge .5] = -\left[e^{-2y}\right]\Big|_{.5}^{\infty}$$

 $P[Y \ge .5] = -\left[0 - e^{-1}\right]$
 $P[Y \ge .5] = .3679$

We multiply the two to find:

$$P[\min(X, Y) \ge .5] = (.1353)(.3679)$$
$$P[\min(X, Y) \ge .5] = .049787$$

(d) Similar to part (c), we write:

$$P[\max(X,Y) \le .5] = P[X \le .5, Y \le .5] \to P[X \le .5] P[Y \le .5]$$

This gives us:

$$P[X \le .5] = \int_0^{.5} 4e^{-4x} dx$$
$$P[Y \le .5] = \int_0^{.5} 2e^{-2y} dy$$

We solve to get:

$$P[X \le .5] = \int_0^{.5} 4e^{-4x} dx$$
$$P[X \le .5] = -\left[e^{-4x}\right]_0^{.5}$$

$$P[X \le .5] = -[e^{-2} - 1]$$

 $P[X \le .5] = .8647$

$$P[Y \le .5] = \int_0^{.5} 2e^{-2y} \, dy$$

$$P[Y \le .5] = -\left[e^{-2y}\right] 0^{.5}$$

$$P[Y \le .5] = -[e^{-1} - 1]$$

 $P[Y \le .5] = .6321$

We then multiply the two to find:

$$P[\max(X,Y) \le .5] = (.8647)(.6321)$$
$$P[\max(X,Y) \le .5] = .5466$$

2. (a) We may find the CDF as:

$$F_X(x) = \int_0^x f_X(x) \, dx$$

This gives us:

$$F_X(x) = \int_0^x \frac{x}{50} \, dx$$

We evaluate to get:

$$F_X(x) = \left[\frac{x^2}{100}\right]\Big|_0^x$$

$$F_X(x) = \begin{cases} \frac{x^2}{100}, & 0 \le x \le 10\\ 1, & x > 10\\ 0, & \text{otherwise} \end{cases}$$

(b) Given the independence of X_1 and X_2 , we may express this probability as:

$$P[X_1 \le 5, X_2 \le 5] = (F_X(5))^2$$

This gives us:

$$P[X_1 \le 5, X_2 \le 5] = \left(\frac{1}{4}\right)^2$$

$$P[X_1 \le 5, X_2 \le 5] = \frac{1}{16}$$

(c) Once again, due to the independence, we may write:

$$F_W[w] = P[W \le w] = (P[X \le w])^2$$

Since we are given w = 5, we simply use the answer from (b):

$$F_W[5] = (P[X \le 5])^2$$
$$F_W[5] = \frac{1}{16}$$

(d) We may observe that the CDF may be written as the product of the two individual CDFs; however, because they are independent, identically distributed systems, we obtain:

$$F_W(w) = F_{X_1}(w)F_{X_2}(w)$$

$$F_W(w) = F_X(w)F_X(w) \quad (X_1 = X_2)$$

$$F_W(w) = [F_X(w)]^2$$

This gives us:

$$F_W(w) = \begin{cases} \frac{w^4}{10000}, & 0 \le w \le 10\\ 1, & w > 10\\ 0, & \text{otherwise} \end{cases}$$

4. (a) To find $P[X \le 1]$, we must first find the individual PDF of x. We begin by finding this:

$$f_X(x) = \frac{1}{24} \int_0^4 x + y \, dy$$

This gives us:

$$f_X(x) = \frac{1}{48} \left[2xy + y^2 \right] \Big|_0^4$$

 $f_X(x) = \frac{x}{6} + \frac{1}{3}, \quad 0 \le x \le 2$

From here, we get:

$$P[X \le 1] = \int_0^1 f_X(x) \, dx$$
$$P[X \le 1] = \frac{1}{6} \int_0^1 x + 2 \, dx$$
$$P[X \le 1] = \frac{1}{12} \left[x^2 + 4x \right] \Big|_0^1$$

$$P[X \le 1] = \frac{5}{12}$$

(b) We may write the conditional PDF as:

$$f_{XY|A}(x,y) = \frac{f_{XY}(x,y)}{f(A)}$$

As determined in part (a), this gives us:

$$f_{XY|A}(x,y) = \frac{(x+y)/24}{5/12}, \quad 0 \le x \le 1, \ 0 \le y \le 4$$

We simplify to get:

$$f_{XY|A}(x,y) = \frac{x+y}{10}, \quad 0 \le x \le 1, \ 0 \le y \le 4$$

(c) Using the result from part (b), we may write the conditional marginal PDFs as:

$$f_{X|A}(x) = \int_0^4 f_{XY|A}(x, y) \, dy$$

$$f_{Y|A}(y) = \int_0^1 f_{XY|A}(x, y) dx$$

We expand this to get:

$$f_{X|A}(x) = \int_0^4 \frac{x+y}{10} \, dy$$

$$f_{Y|A}(y) = \int_0^1 \frac{x+y}{10} \, dx$$

We then solve:

$$f_{X|A}(x) = \frac{2xy + y^2}{20} \Big|_0^4$$

$$f_{X|A}(x) = \frac{2x+4}{5}, \quad 0 \le x \le 1$$

$$f_{Y|A}(y) = \frac{x^2 + 2xy}{20} \Big|_{0}^{1}$$

$$f_{Y|A}(y) = \frac{1+2y}{20}, \quad 0 \le y \le 4$$

We can then use the first result to find:

$$E[X|A] = \int_0^1 x \left(\frac{2x+4}{5}\right) dx$$

$$E[X|A] = \int_0^1 \frac{2x^2 + 4x}{5} dx$$

$$E[X|A] = \frac{2x^3 + 6x^2}{15} \Big|_0^1$$

$$E[X|A] = \frac{8}{15}$$

6. (a) We can find $f_Y(y)$ as:

$$f_Y(y) = \int_{-2}^{y} \frac{1}{8} dx$$
$$f_Y(y) = \left[\frac{1}{8} \right]_{-2}^{y}$$
$$f_Y(y) = \frac{y}{8} + \frac{1}{4}$$

- (b)
- (c)
- (d)
- (e)
- 7. (a)
 - (b)
 - (c)
 - (d)
- 8. (a)
 - (b)
 - (c)
 - (d)
 - (e)
- 9. (a) We may begin by expressing the joint PMF as a matrix:

$$P_{XY}(x,y) = \begin{bmatrix} 0 & 1/8 & 3/8 & 1/4 \\ 0 & 0 & 1/8 & 0 \\ 0 & 0 & 0 & 1/8 \\ 0 & 0 & 0 & 0 \end{bmatrix}$$

Summing the columns, we see that $X=\{2,3,4\}$ with probabilities $\left\{\frac{1}{8},\frac{1}{2},\frac{3}{8}\right\}$, respectively. Similarly, summing the rows shows us that $Y=\{1,2,3\}$ with probabilities $\left\{\frac{3}{4},\frac{1}{8},\frac{1}{8}\right\}$, respectively. Using this gives us:

$$E[X] = \frac{1}{8}(2) + \frac{1}{2}(3) + \frac{3}{8}(4)$$

$$E[Y] = \frac{3}{4}(1) + \frac{1}{8}(2) + \frac{1}{8}(3)$$

We solve to get:

$$E[X] = \frac{13}{4}$$

$$E[Y] = \frac{11}{8}$$

(b) To find the variances, we begin by writing:

$$E[X^2] = \frac{1}{8}(2)^2 + \frac{1}{2}(3)^2 + \frac{3}{8}(4)^2$$

$$E[Y^2] = \frac{3}{4}(1)^2 + \frac{1}{8}(2)^2 + \frac{1}{8}(3)^2$$

This gives us:

$$E[X^2] = 11$$

$$E[Y^2] = \frac{19}{8}$$

We then find the variance as:

$$Var(X) = E[X^2] - (E[X])^2$$

$$Var(Y) = E[Y^2] - (E[Y])^2$$

This gives us:

$$Var(X) = 11 - \frac{169}{16}$$

$$Var(Y) = \frac{19}{8} - \frac{121}{64}$$

And finally:

$$Var(X) = .4375$$

$$Var(Y) = .4844$$

(c) We can find the correlation as:

$$r_{X,Y} = E[XY] = \sum \sum xyP(x,y)$$

We expand this to get:

$$r_{X,Y} = \frac{1}{8}(2)(1) + \frac{3}{8}(3)(1) + \frac{1}{4}(4)(1) + \frac{1}{8}(3)(2) + \frac{1}{8}(4)(3)$$

Solving gives us:

$$r_{X,Y} = \frac{37}{8} = 4.625$$

(d) The covariance may be written as:

$$Cov(X,Y) = E[XY] - E[X]E[Y]$$

Using our obtained values gives us:

$$Cov(X, Y) = 4.625 - (3.25) (1.375)$$

$$\boxed{Cov(X, Y) = .1562}$$

(e) We can then write the correlation coefficient as:

$$\rho_{X,Y} = \frac{\text{Cov}(X,Y)}{\sqrt{\text{Var}(X)\text{Var}(Y)}}$$

This gives us:

$$\rho_{X,Y} = \frac{.1562}{\sqrt{(.4375)(.4844)}}$$

$$\boxed{\rho_{X,Y} = .3394}$$
